

PravahAI Frontend Redesign — Final Master Prompt

You are a senior product designer and frontend engineer.

Your task is to completely redesign the frontend experience of the existing platform into a premium AI-powered traffic intelligence platform called **PravahAI**.

IMPORTANT:

- Frontend redesign only.
- Do NOT modify backend logic.
- Do NOT modify APIs.
- Do NOT modify database schemas.
- Do NOT modify forecasting logic.
- Do NOT modify SERI calculations.
- Do NOT modify Shadow Event discovery logic.
- Do NOT modify hotspot detection.
- Do NOT modify KNN similarity.
- Do NOT modify learning engine.
- Do NOT modify Gemini integration.
- Use existing APIs and existing data only.
- Preserve all current functionality.

The redesign must accurately reflect what the backend actually does.

===== BRANDING
=====

Rename visible branding:

ShadowEvent AI

→

PravahAI

Keep "Shadow Event" ONLY where it refers to the actual methodology, model, feature, or risk pattern.

Examples:

✓ PravahAI

✓ PravahAI Traffic Intelligence Platform

✓ PravahAI Operations Center

✓ Shadow Events

✓ Shadow Event Discovery

✓ Shadow Event Risk Index (SERI)

===== PRODUCT POSITIONING
=====

The platform should feel like:

"PravahAI — A Predictive Traffic Intelligence Platform that discovers recurring traffic risks, forecasts disruptions, and recommends operational interventions before incidents occur."

NOT:

- Generic admin dashboard
- Analytics template
- SaaS starter dashboard
- AI-generated dashboard clone

Design inspiration:

- Palantir Gotham
- Linear
- Stripe
- Vercel
- Bloomberg Terminal
- Mission Control Systems

===== VISUAL STYLE
=====

Theme:

Background:

030712

Primary:

190a33

Secondary:

6e1842

Accent:

00D4FF

Success:

00E676

Warning:

FFC857

Critical:

FF5A5F

Glass Panels:

Background: rgba(17,24,39,0.55)

Border: rgba(255,255,255,0.08)

Use:

- glassmorphism
- subtle aurora gradients
- premium typography
- modern spacing
- soft shadows
- subtle glows
- high information density

Avoid:

- neon overload

- cartoon effects
- generic admin-dashboard styling
- oversized empty cards

===== REMOVE ALL EMOJIS
=====

Remove every emoji from the application.

Replace with:

- Lucide icons
- SVG icons
- professional iconography

No emojis anywhere.

===== ACCESSIBILITY
=====

Audit every page.

Fix:

- white text on white backgrounds
- unreadable labels
- low contrast
- inaccessible colors

All pages must remain highly readable in dark mode.

===== INFORMATION HIERARCHY
=====

The platform must answer:

1. What is happening?
2. Where is risk concentrated?
3. What will likely happen next?
4. What action should operators consider?

Prioritize:

Risk → Forecast → Intelligence → Recommendation

over generic KPIs.

===== HOMEPAGE REDESIGN
=====

Homepage becomes a Traffic Intelligence Command Center.

Layout:

70% Left

30% Right

===== LEFT SIDE
=====

Large Bengaluru Intelligence Map.

This must be the visual centerpiece.

Display:

- Heatmap Layer
- Hotspots
- Shadow Events
- Forecast Corridors
- SERI Risk Overlays

The map should dominate the page.

===== RIGHT SIDE
=====

Operational Intelligence Panel.

Display:

- Overall Risk Status
- Highest Risk Corridor
- Critical Shadow Events
- Forecast Precision
- Active Alerts
- Recommended Operational Action

Use actual API data only.

Do NOT display fake metrics.

===== IMPORTANT
=====

Do NOT display:

"Current Traffic Conditions"

because live traffic feeds are not available.

Instead display:

Operational Risk View

using:

- SERI
- Forecasts
- Hotspots
- Shadow Events

===== FORECAST VALIDATION PANEL
=====

Do NOT display generic:

"Forecast Confidence"

Instead display actual validation metrics.

Show:

- Accuracy
- Precision
- Recall
- F1 Score

Highlight Precision prominently.

Example:

Forecast Precision 88%

because this is validated and defensible.

===== OPERATIONAL READINESS PANEL
=====

Do NOT show:

- Estimated Personnel
- Officer Counts
- Vehicle Counts
- Exact Manpower Predictions

The system does not predict manpower.

Instead display:

Operational Readiness

Levels:

- Low
- Medium
- High
- Critical

Display:

Recommended Resource Posture

Examples:

- Additional Monitoring
- Traffic Unit Coordination
- Breakdown Response Standby
- Temporary Barricading Review
- Diversion Playbook Review

Always display:

"Advisory Estimate — Requires Human Review"

===== SHADOW EVENTS SECTION
=====

Create premium intelligence cards.

Display:

- Corridor
- Day
- Time Bucket
- SERI

- Recurrence Score
- Risk Band

This section should feel like the core intelligence engine.

Give it significant visual emphasis.

===== FORECAST SECTION
=====

Create a forecast experience similar to weather forecasting.

Display:

- High Risk Corridors
- Medium Risk Corridors
- Predicted Risk Windows
- Forecast Metrics

Forecasts should be immediately understandable.

===== SIMILARITY INTELLIGENCE SECTION
=====

Visualize:

Current Event → Similar Historical Incidents → Historical Risk Pattern → Recommended Advisory

Do NOT display:

Historical Outcome

because outcome labels do not exist.

===== AI ADVISORY ENGINE SECTION
=====

Create a premium advisory interface.

Display:

- Historical Risk
- Forecast Risk
- Hotspot Risk
- Similar Incidents
- Generated Advisory

Display advisory source:

- Gemini
- Rule-Based Fallback

Show source clearly.

This should be one of the strongest sections of the platform.

===== DIVERSION PLAYBOOKS
=====

Add Diversion Playbook support.

IMPORTANT:

Do NOT claim:

- Route Optimization
- Traffic Simulation
- Optimal Routing
- Dynamic Traffic Assignment

Instead display:

Suggested Diversion Playbooks

For affected corridors show:

- Suggested Alternate Corridors
- Monitoring Zones
- Operational Notes

Label clearly:

"Operational Guidance — Requires Human Approval"

Diversion plans should be recommendations, not optimized routes.

===== SIDEBAR RESTRUCTURE
=====

Overview

Intelligence

- Shadow Events

- Forecast
- Similarity Explorer

Operations

- Impact Map
- Risk Calendar
- What-If Simulator
- Advisory Center

Analytics

- Incident Analysis
- Corridor Analysis
- Cause Analysis
- SERI Analysis
- Forecast Validation
- Historical Trends

Knowledge

- Repository
- Methodology

Learning

- Learning Engine

Add:

- active state glow
- improved spacing
- cleaner hierarchy
- premium navigation

===== ANALYTICS MODULE
=====

Retain all existing analytical capabilities.

Do NOT remove existing analytics.

Instead reorganize them under a dedicated Analytics section.

Requirements:

1. Preserve existing charts and analysis unless redundant.

2. Analytics should automatically reflect updated processed datasets.

3. Analytics should support:

4. explainability

5. validation

6. methodology

7. judge evaluation

8. Analytics pages should be more data-dense.

9. Analytics should answer:

"Why does the system believe this?"

Operational pages should answer:

"What should operators do?"

===== CHARTS
=====

Reduce chart clutter.

Remove generic dashboard-style visualizations where possible.

Prefer:

- ranked corridor lists
- intelligence cards
- timeline views
- risk rankings
- operational summaries

The platform should feel like an intelligence system, not a BI dashboard.

===== ANIMATIONS
=====

Use Framer Motion.

Add:

- smooth transitions

- hover elevation
- glow interactions
- animated counters
- page transitions

Animations must remain professional.

===== MAP-FIRST DESIGN
=====

Current platform is card-first.

Transform into:

Map → Intelligence → Forecast → Recommendation

Hierarchy.

Maps should dominate operational pages.

===== FINAL GOAL
=====

A judge opening the platform should immediately understand:

1. Where risk exists.
2. Which corridors are vulnerable.
3. Which Shadow Events are recurring.
4. What the forecast predicts.
5. What actions should be considered.
6. Why the platform believes those predictions.

The platform should feel like a real traffic intelligence and operations center.

Do not create fake capabilities.

Every visible metric must be traceable to an existing backend computation.

Preserve all existing functionality while significantly elevating design quality, usability, operational clarity, and perceived sophistication.
